Technique to remove pains in one second
Upper and lower dentures that are made based on the design with no horizontal mobility.

Locked denture does not move even when we try to move it from left to right.
After an adjustment, denture can move horizontally freely.
Pain is removed by just having a bite control by the technical specialist.
hamular notch cannot be usually cut nor be removed.
The upper denture does not fall when opening the mouth, I can eat now!
These pictures are taken at a seminar. They are the denture of a patient whose only foretooth hit when biting.
grinding point using stump bur. Be careful about the angle.
If you have time, add more sokujyu on occlusal surface.
Almost no spillway

Front teeth occlusal adjustment will stop hitting vertically

Making Spillway

Almost no spillway

It is often said brushing teeth causes these problems.
Was brushing really the cause of the problem? Is that true?
Deciding and measuring the correct bite... the way to keep it unchanged. How to take an dental impression accurately. Can be changed and produced immediately. Able to bite with front teeth when wearing full denture. Opening a big mouth won’t let the denture become loose or fall.
Difference in thickness of frenulum linguæ
This is the case of no residual ridge, it’s considered to be a difficult but actually an easiest case for the complete denture.
I could eat pork cutlet after a long interval.
Having entire base adjusted brings the tongue forward.

Patent No. 3829124
Photos from a magazine!
Sweet potato chips
Bite with front teeth
Able to bite sweet potato chips with front teeth when wearing full denture.
